Summary

I build software around language models with a focus on predictable behavior rather than raw capability. While developing automation tools, I repeatedly encountered issues such as ambiguous instructions, over-confident outputs, and unintended actions. My work centers on adding structure, validation, and human oversight so systems remain useful without becoming unsafe.

Technical Skills

Languages: Python, C++, JavaScript, SQL

Systems: APIs, async workflows, structured logging, debugging unpredictable behavior

AI Workflows: prompt design, constrained outputs, evaluation loops, retrieval pipelines

Data: PostgreSQL, SQLite, vector search

Tools: Linux, Git, Docker (basic)

Selected Work

Intent Guard AI

- Added a verification step before automated actions produced by an AI agent
- Flags unclear or potentially harmful instructions and requests confirmation
- Developed from observing that models often follow instructions literally even when intent is uncertain

ManagerGPT

- Converts high-level goals into ordered steps that users can inspect before execution
- Prevents single-message outputs from triggering large unintended operations
- Designed to keep humans supervising multi-step automation rather than removing them

Fake Job Posting Detector

- Detects suspicious job listings and explains why they may be risky
- Focused on communicating uncertainty instead of giving confident binary judgments
- Motivated by real cases where confident systems can mislead users

AI Workflow Logging Experiment

- Logged prompts, intermediate reasoning, and outputs to understand failure cases
- Used traces to diagnose why systems behave differently from user expectations

Experience

Deloitte Data Analytics Simulation

2026

- Analyzed datasets to identify irregular patterns and explain findings clearly
- Practiced reasoning under uncertainty and communicating conclusions cautiously

Education

B.Tech Computer Science
Indian Institute of Information Technology Kottayam
Expected 2028

Technical Interests

AI reliability, alignment, human oversight, evaluation of model behavior, safe deployment of automation
